

Alternative: use of **empirical cross sections** for the production of projectile fragments
 prediction of « exotic » nuclei yields at GSI: « **EPAX** » parametrization
 valid in the « limiting-fragmentation » regime (σ independent of E_{bomb})

Limitation: says nothing about the « participants » or the target remnant, which also
 contribute to the deposited energy in an event.

These results must be used to **cross check** the **GEANT4** predictions!
